# Phase 2

### **Problem Definition**

Banks play a crucial role in market economies. They decide who can get finance and on what terms and can make or break investment decisions. For markets and society to function, individuals and companies need access to credit.

Credit scoring algorithms, which make a guess at the probability of default, are the method banks use to determine whether or not a loan should be granted. By predicting the probability that somebody will experience financial distress in the next two years. The goal is to build a model that borrowers can use to help make the best financial decisions.

Improve on the state of the art in credit scoring by predicting the probability that somebody will experience financial distress in the next two years.

# GitHub (https://github.com/mganeshan29/Credit-Scoring-model)

#### **Dataset**

#### **Give Me Some Credit**

In this Model, credit scoring data sets from Kaggle competition called 'Give me some credit' is used to build classifiers

Training dataset cs-training.csv file (https://www.kaggle.com/brycecf/give-me-some-credit-dataset?select=cs-training.csv) which will be used for model training and test data cs-test.csv file (https://www.kaggle.com/brycecf/give-me-some-credit-dataset?select=cs-test.csv)

# **Prepare Data**

In this part, the data and variables is done. Target ratio, variables values distributions are also be investigated. Null value analysis is done and null values in variables, filled with statistical approach to prevent them to influence modelling in a bad way.

After the describing inputs, missing values are also investigated, and for 2 inputs ('MonthlyIncome', 'NumberOfDependents') some missing values are observed. Handling with missing values is very important to create accurate models.

#### **Data Dictionary:**

Variable Name	Description	Туре
SeriousDlqin2yrs	Person experienced 90 days past due delinquency or worse	Y/N
RevolvingUtilizationOfUnsecuredLines	Total balance on credit cards and personal lines of credit except real estate and no installment debt like car loans divided by the sum of credit limits	percentage
age	Age of borrower in years	integer
NumberOfTime30- 59DaysPastDueNotWorse	Number of times borrower has been 30-59 days past due but no worse in the last 2 years.	integer
DebtRatio	Monthly debt payments, alimony, living costs divided by monthy gross income	percentage
MonthlyIncome	Monthly income	real
NumberOfOpenCreditLinesAndLoans	Number of Open loans (installment like car loan or mortgage) and Lines of credit (e.g. credit cards)	integer
NumberOfTimes90DaysLate	Number of times borrower has been 90 days or more past due.	integer
NumberRealEstateLoansOrLines	Number of mortgage and real estate loans including home equity lines of credit	integer
NumberOfTime60- 89DaysPastDueNotWorse	Number of times borrower has been 60-89 days past due but no worse in the last 2 years.	integer
NumberOfDependents	Number of dependents in family excluding themselves (spouse, children etc.)	integer

# Python packages

#### **NumPy**

NumPy is a well known general-purpose array-processing package. An extensive collection of high complexity mathematical functions make NumPy powerful to process large multi-dimensional arrays and matrices. NumPy is very useful for handling linear algebra, Fourier transforms, and random numbers.

#### Scikit-learn

The Python library, Scikit-Learn, is built on top of the matplotlib, NumPy, and SciPy libraries. This Python ML library has several tools for data analysis and data mining tasks.

#### **Pandas**

Pandas is a popular Python library for data analysis. It is not directly related to Machine Learning. As we know that the dataset must be prepared before training. In this case, Pandas comes handy as it was developed specifically for data extraction and preparation.

## Matplotlib

Matplotlib is a very popular Python library for data visualization. Like Pandas, it is not directly related to Machine Learning. It particularly comes in handy when a programmer wants to visualize the patterns in the data. It is a 2D plotting library used for creating 2D graphs and plots.

#### seaborn

Seaborn is a library for making statistical graphs in Python. It is built on top of matplotlib and also integrated with pandas data structures.

## Scikit-plot

Scikit-plot is the result of an unartistic data scientist's dreadful realization that visualization is one of the most crucial components in the data science process, not just a mere afterthought.

# **Importing Libraries**

```
In [147]: import itertools
          import numpy as np
          import pandas as pd
          import matplotlib.pyplot as plt
          import scikitplot as skplt
          from sklearn import metrics
          import plotly.graph objs as go
          from plotly.offline import iplot
          from sklearn.metrics import f1 score
          from sklearn.metrics import precision score
          from sklearn.metrics import confusion matrix
          from sklearn import model selection
          from sklearn.neighbors import KNeighborsClassifier
          from sklearn.naive bayes import GaussianNB
          from sklearn.tree import DecisionTreeRegressor
          from sklearn.datasets import make_classification
          from sklearn.linear model import LogisticRegression
          from sklearn.model selection import train test split
          from sklearn.metrics import accuracy score, confusion matrix, roc curve, auc, recall score, roc auc sc
          from sklearn.metrics import recall score
          %matplotlib inline
          import warnings
          warnings.filterwarnings('ignore')
```

# **Data analysis**

```
In [148]: train data = pd.read csv("cs-training.csv")
          test data = pd.read csv("cs-test.csv")
```

#### **Review data**

```
In [149]: print(train_data.describe)
          print(train_data.head)
                                                  7
                                                                           0
          149995

```

# **Applying Machine Learning Algorithms for Classification Problem**

# logistic-regression

Logistic regression is one of the most popular Machine Learning algorithms, which comes under the Supervised Learning technique. It is used for predicting the categorical dependent variable using a given set of independent variables.

#### specify the target variable

```
In [155]: train_y = reduced_train_data.SeriousDlqin2yrs
          test y = reduced test data.SeriousDlqin2yrs
```

#### create list of features

```
In [156]: | feature names = ['RevolvingUtilizationOfUnsecuredLines', 'age',
                  'NumberOfTime30-59DaysPastDueNotWorse', 'DebtRatio',
                  'NumberOfOpenCreditLinesAndLoans', 'NumberOfTimes90DaysLate',
                  'NumberRealEstateLoansOrLines', 'NumberOfTime60-89DaysPastDueNotWorse']
          #create data corresponding to the features
          train X = reduced train data[feature names]
          test_{\overline{X}} = reduced test data[feature names]
```

#### **Spiliting Dataset into Train and Test set.**

```
In [157]: x_train, x_test, y_train, y_test = train_test_split(train_X, train_y, test_size = 0.3, random_state
```

## **Logistic regression User Defined**

```
In [158]:
          class logistic regression:
              def init (self,x,v):
                  self.intercept = np.ones((x.shape[0], 1))
                  self.x = np.concatenate((self.intercept, x), axis=1)
                  self.weight = np.zeros(self.x.shape[1])
                  self.v = v
              def sigmoid(self, x, weight):
                  z = np.dot(x, weight)
                  return 1 / (1 + np.exp(-z))
              def loss(self, h, y):
                  return (-y * np.log(h) - (1 - y) * np.log(1 - h)).mean()
              def gradient descent(self, X, h, y):
                  return np.dot(X.T, (h - y)) / y.shape[0]

# K-Nearest Neighbor(KNN) Algorithm

K-Nearest Neighbour is one of the simplest Machine Learning algorithms based on Supervised Learning technique.

K-NN algorithm assumes the similarity between the new case/data and available cases and put the new case into the category that is most similar to the available categories.

```
In [195]: model_KNN = KNeighborsClassifier()

neighbors = [1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20]
model_KNN.fit(x_train, y_train)
knn = KNeighborsClassifier(n_neighbors = 20)
knn.fit(x_train, y_train)
knn_scores_proba = knn.predict_proba(x_train)
knn_scores = knn_scores_proba[:,1]
print("AUC Score :", roc_auc_score(y_train,knn_scores))

# **Gaussian Naive Bayes**

Gaussian Naive Bayes is a variant of Naive Bayes that follows Gaussian normal distribution and supports continuous data. We have explored the idea behind Gaussian Naive Bayes along with an example.

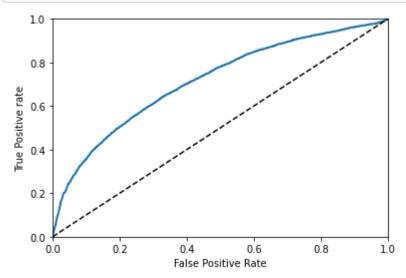

Before going into it, we shall go through a brief overview of Naive Bayes.

Naive Bayes are a group of supervised machine learning classification algorithms based on the Bayes theorem. It is a simple classification technique, but has high functionality. They find use when the dimensionality of the inputs is high.<\i>

```

# **Model Tuning using KFold Validation**

Cross-validation is a statistical method used to estimate the skill of machine learning models.

It is commonly used in applied machine learning to compare and select a model for a given predictive modeling problem because it is easy to understand, easy to implement, and results in skill estimates that generally have a lower bias than other methods.

```
In [264]: from sklearn.model_selection import KFold
X, y = make_classification(n_samples=100, n_features=20, n_informative=15, n_redundant=5, random_sta
# prepare the cross-validation procedure
cv = KFold(n_splits=10, random_state=1, shuffle=True)
kfold = KFold(n_splits=10, random_state=None)
```
